IN THE CLAIMS

+

Please cancel claims 1-6 and 13-18 as follows:

1. (previously presented) A system for data entry in a wireless communication device, the system comprising:

an audio-input device to receive audio-data;

- a voice-recognition engine to receive and analyze the audio-data, wherein the voice-recognition engine is configured to interpret the audio-data as matching a selected one of a set of alphanumeric characters to use in conjunction with the operation of the wireless communication device; and
- a memory to store the selected alphanumeric character for subsequent use in conjunction with the operation of the wireless communication device, wherein the voice-recognition engine is further configured to interpret the audio-data as matching a selected one of a set of commands, the system further comprising a processor to execute the selected command.
 - 2. (canceled)
- 3. (Original) The system of claim 1, further comprising a transmitter to transmit the selected alphanumeric character to a remote location.
- 4. (Original) The system of claim I wherein the memory stores a plurality of selected alphanumeric characters, the plurality of selected alphanumeric characters comprising at least a portion of an electronic message, the system further comprising a transmitter to transmit the electronic message to a remote location.
- 5. (Original) The system of claim 4 wherein the electronic message is compatible with a short-messaging-service protocol.

- 6. (Original) The system of claim 4 wherein the voice-recognition engine is further configured to interpret the audio-data as matching a selected one of a set of commands to process the electronic message, the system further comprising a processor to execute the selected command.
- 7. (previously presented) A system for storing addresses in a wireless communication device, the system comprising:

an audio-input device to receive audio-data;

- a voice-recognition engine to receive and analyze the audio-data, wherein the voice-recognition engine is configured to interpret the audio-data as matching a selected one of a set of alphanumeric characters;
- a processor to associate an address-identifier with a plurality of selected alphanumeric characters; and

a memory to store the plurality of selected alphanumeric characters in association with the associated address-identifier, wherein the voice-recognition engine is further configured to interpret the audio-data as matching a selected one of a set of commands to process the plurality of selected alphanumeric characters and the associated address-identifier, the processor executing the selected command.

8. (canceled)

- 9. (Original) The system of claim 7 wherein the plurality of selected alphanumeric characters associated with the address-identifier represents at least part of a destination telephone number.
- 10. (Original) The system of claim 7 wherein the plurality of selected alphanumeric characters associated with the address-identifier represents at least part of an electronic address.

- 11. (Original) The system of claim 7 wherein the plurality of selected alphanumeric characters associated with the address-identifier represents at least part of a street address.
- 12. (Original) The system of claim 7 wherein the voice-recognition engine is further configured to interpret the audio-data as the address-identifier.
- 13. (previously presented)A method for data entry in a wireless communication device, the method comprising:

receiving audio-data;

configuring the wireless communication device to interpret the audio-data as matching a selected one of a set of alphanumeric characters to use in conjunction with the operation of the wireless communication device;

storing the selected alphanumeric character for subsequent use in conjunction with the operation of the wireless communication device; and

configuring the wireless communication device to interpret the audio-data as matching a selected one of a set of commands and executing the selected command.

14. (canceled)

- 15. (Original) The method of claim 13, further comprising transmitting the selected alphanumeric character to a remote location.
- 16. (Original) The method of claim 13, further comprising storing a plurality of selected alphanumeric characters, the plurality of selected alphanumeric characters comprising at least a portion of an electronic message, and transmitting the electronic message to a remote location.
- 17. (Original) The method of claim 16 wherein the message is compatible with a short-messaging-service protocol.

990517; 09/847,474

- 18. (Original) The method of claim 16, further comprising configuring the wireless communications device to interpret the audio-data as matching a selected one of a set of commands to process the electronic message and executing the command.
- 19. (previously presented)A method for storing addresses in a wireless communication device, the method comprising:

receiving audio-data;

configuring the wireless communications device to interpret the audio-data as matching a selected one of a set of alphanumeric characters;

associating a plurality of selected alphanumeric characters with an address-identifier;

storing the plurality of selected alphanumeric characters in association with the associated address-identifier; and

configuring the wireless communication device to interpret the audio-data as matching a selected one of a set of commands to process the plurality of selected characters and the associated address-identifier and executing the selected command.

20. (canceled)

- 21. (Original) The method of claim 19 wherein the plurality of selected characters associated with the address-identifier represents at least part of a destination telephone number.
- 22. (Original) The method of claim 19 wherein the plurality of selected characters associated with the address-identifier represents at least part of an electronic address.
- 23. (Original) The method of claim 19 wherein the plurality of selected characters associated with the address-identifier represents at least part of a street address.
- 24. (Original) The method of claim 19, further comprising configuring the wireless communication device to interpret the audio-data as the address-identifier.
